

QUALITY OF WATER = QUALITY OF LIFE!

Don't be fooled into buying a Reverse Osmosis System!

FACTS:

- Many utility companies now supply RO water.
- Using an RO system on RO water is wasteful. Undersink RO systems require 4 or more gallons of water to produce 1 gallon of RO water. Utilities charge for water coming into and exiting your home – doubling the expense!
- Do the math: 4 gallons in to make 1 gallon to drink, 4 gallons out = 9 gallons charged by the utility.
- Saves the extra water without a holding tank!

Here's a cost effective way to have limitless, pure, safe, great tasting water without harsh chemicals!

Alkaline water right from your tap!

Alkaline water at grocery stores can run as much as \$4 a gallon. Multiply that times how many gallons you consume in a year, and you'll see that the unit will pay for itself very quickly.

You'll have unlimited, pH balanced, mineralized water!

FEATURES:

- ▶ Sediment filter removes small particles and microbes suspended in water
- ▶ Activated carbon filter removes foul chemicals that cause unpleasant tastes and odors
- ▶ Mineralizer adds important minerals and provides proper pH balanced water
- ▶ Ultraviolet unit provides instant sterilization of the water seconds before consumption
